

ABSTRACT OF THE DISCLOSURE

The present invention provides for a pressure development apparatus for an image forming device which includes a first pressure roller that has a width which is at least approximately equal to a media width of media to be developed and is adapted to apply pressure onto a surface of media to be developed. The development apparatus also includes at least a block-like member or a second roller mounted on top of the first pressure roller which is adapted to apply pressure onto the first pressure roller for the purpose of developing media to be developed. The block-like member or second pressure roller is effective to minimize any lateral deflection of the first pressure roller.
